

Market Microstructure and Algorithmic Trading Final Paper

Start Assignment

- Due Wednesday by 11:59pm
- Points 50
- Submitting a file upload
- File Types ipynb, pdf, zip, and html
- Available Nov 17 at 6:30pm - Dec 17 at 11:59pm

The final paper requires you to use the NYSE TAQ Level 1, CME Level 2, Crypto Level I, Crypto Level II, SpiderRock and/or LOBSTER data to perform original research. Build your own Jupyter notebook using the techniques learned throughout the course as well as machine learning techniques you've learned throughout the program.

Requirements

- This project must be performed and submitted in **groups of 4-5 students** (a combination of 2 homework teams with the possibility of an extra student who did not partner for the homework assignments).
- You must submit **three files**: the **Jupyter notebook (.ipynb)**, an **HTML (.html)** file which is generated by exporting your Jupyter notebook and a **PDF (.pdf) report** (not to exceed 6 pages) with your write-up. These may be combined into a **single ZIP (.zip) file**.
- Workbooks **must execute without errors from beginning to end within 15 minutes to receive full credit**. To help with this, you may submit an extra model files that contains a trained model object. Note that **ONNX** [↗\(https://onnx.ai/onnx/\)](https://onnx.ai/onnx/) is a more secure format for **model files** [↗\(https://scikit-learn.org/stable/model_persistence.html\)](https://scikit-learn.org/stable/model_persistence.html) than pickle.
- Please specify any extra anaconda packages that are required to run your analysis.
- Your submission should include a **clear statement of the topic** you are investigating, a **thorough description of the steps of your analysis**, and an **explanation** and **interpretation** of your results.
- Your submission must include a **minimum of two relevant tables and formulas** to help elucidate your analysis.
- You must also generate **fully-labeled charts** to help make your presentation clear.
- Your submission must provide at **least one reference**, and possibly more, relating to your analysis (e.g., where you got the idea for your analysis or related work on the same topic).
- The write-up should be a **polished report, rather than a collage** compiled from each contributor.
- If your project involves training a predictive model on a training sample, **be sure your hold-out testing sample is after your training sample**. For example, you should use **TimeSeriesSplit** [↗\(https://scikit-learn.org/dev/modules/generated/sklearn.model_selection.TimeSeriesSplit.html\)](https://scikit-learn.org/dev/modules/generated/sklearn.model_selection.TimeSeriesSplit.html) to perform K-Fold cross validation.

Suggestions

You are not limited to single-security analysis and can therefore look for lead-lag effects across securities, if relevant, for the question you are investigating. Similarly, you are not limited to single-exchange analysis and can therefore look for latency arbitrage opportunities between venues.

Demonstrate your understanding of the concepts introduced in this course by commenting qualitatively (if not quantitatively) on how market impact would effect your analysis.

You may refer to [recent papers](https://www.connectedpapers.com/main/6def0370e9733d233991d862483249e556501972/Microstructure-in-the-Machine-Age/graph) [↗\(https://www.connectedpapers.com/main/6def0370e9733d233991d862483249e556501972/Microstructure-in-the-Machine-Age/graph\)](https://www.connectedpapers.com/main/6def0370e9733d233991d862483249e556501972/Microstructure-in-the-Machine-Age/graph) and the below list for ideas, or create your own. Extra points will be given for innovative work.

Ideas

- Mean-variance analysis of an optimal order-execution algorithm ([Almgren and Chriss](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=53501) [↗\(https://papers.ssrn.com/sol3/papers.cfm?abstract_id=53501\)](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=53501), or with conditional information)
- Analysis of intraday data using machine learning techniques. i.e.: ["The Conduits of Price Discovery: A Machine Learning Approach". Amy Kwan, Richard Philip, Andriy, Shkilko](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3710491) [↗\(https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3710491\)](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3710491)
- Cross-market latency: how do orders on one market affect other markets for the same security

- How quickly does the limit order book (LOB) replenish itself
- Predict whether the next order is a buy or sell
- Predict future volume or order imbalance over the rest of the trading day
- Intraday cross-correlation across a cross-section of stocks or futures contracts. i.e. ["Common Factors in Prices, Order Flows, and Liquidity". Joel Hasbrouck, Duane Seppi](https://www.sciencedirect.com/science/article/abs/pii/S0304405X0000091X)  [\(https://www.sciencedirect.com/science/article/abs/pii/S0304405X0000091X\)](https://www.sciencedirect.com/science/article/abs/pii/S0304405X0000091X)
 - Signed order flow for marketable orders
 - Signed order flow for BBO limit orders
 - BBO spreads
 - LOB depth
 - LOB depth imbalance
 - Time-series of Kyle's λ
- How do different order types affect prices?
 - $\Delta m_t = \mu + \lambda x_t + \epsilon_t$ (where x_t are signed market orders MOs or limit orders LO at the BBO or even behind the BBO)
- Does liquidity look different for predictable and unpredictable orders? Measures of predictability include:
 - Orders on even seconds, minutes, hours
 - Orders where $|x_t - \mathbb{E}_{t-1}[x_t]|$ is small vs large given $\mathbb{E}_{t-1}[x_t]$ is estimated by a time-series regression
- How does the price impact of a particular order type change over time? And what features of the environment induce those changes?
 - Model a time-varying price-impact coefficient $\lambda_t = \lambda(z)$
 i.e. if $\lambda_t = \lambda_1 z_{1,t-1} + \lambda_2 z_{2,t-1}$
 the Kyle equation $\Delta m_t = \mu + \lambda_t x_t + e_t$ becomes $\Delta m_t = \mu + \lambda_1 (z_{1,t-1} x_t) + \lambda_2 (z_{2,t-1} x_t) + e_t$
 - Possible explanatory variables z:
 - Intraday time buckets
 - Prior order-flow imbalance interacted with sign of current order
 - Time duration elapsed since the LO or last MO
 - Volume of prior LO "churn"

Criteria	Ratings					Pts
<p>Kdb+ Knowledge</p> <p>How well does the research demonstrate mastery of Kdb+</p>	<p>4 pts Advanced</p> <p>Implemented new Kdb+ code to perform innovative analytics</p>	<p>3 pts Above Average</p> <p>Implemented new Kdb+ code to perform analytics</p>	<p>2 pts Average</p> <p>Used Kdb+ code from class to analyze data</p>	<p>1 pts Below Average</p> <p>Used kdb+ to download data</p>	<p>0 pts Insufficient</p> <p>No use of Kdb+</p>	4 pts
